**Abstract**—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were 15 women, 40 to 50 years of age, who were sedentary and had no cardiovascular or pulmonary disease. The subjects were randomly assigned to a 10-week training program or a control group. The training program consisted of three sessions per week of aerobic exercise at 60% of maximum HR. The control group did not exercise. The subjects were monitored for HR and EE during the training program and at the end of the program. The results showed that the training program had a significant effect on HR and EE. The HR of the training group decreased significantly from 160 to 140 beats per minute (p < 0.05). The EE of the training group increased significantly from 1,800 to 2,200 kcal per day (p < 0.05). The control group did not show any significant changes in HR or EE. The results of this study suggest that a 10-week training program can improve the cardiovascular and metabolic health of sedentary, middle-aged women.
